Relying on small molecular fragments (MW <300) as versatile templates for hit compound discovery in the Fragment Based Drug Design (FBDD) field, 8 in this work in silico and synthetic skills coupled to experimental measurements of pKa and logD gave the readers access to a systematic assessment of a focused library of fragments endowed with acidic properties. To this end, a Diversity-Oriented Synthetic (DOS) approach was applied, starting from common chemical building blocks in order to ...

Fragment based drug design (FBDD) is a promising approach for the discovery and optimization of lead compounds. Despite its successes, FBDD also faces some internal limitations and challenges. FBDD

requires a high quality of target protein and good solubility of fragments. Biophysical techniques for fragment screening necessitate expensive detection equipment and the strategies for evolving fragment hits to leads remain to be improved.

Fragment Informatics and Computational Fragment Based Drug ...

Fragment-based lead discovery (FBLD) also known as fragment-based drug discovery (FBDD) is a method used for finding lead compounds as part of the drug discovery process. Fragments are small organic molecules which are small in size and low in molecular weight. It is based on identifying small chemical fragments, which may bind only weakly to the biological target, and then growing them or ...

This volume covers the techniques necessary for a successful fragment-based drug design project, beginning from defining the problem in terms of preparing the protein model, identifying potential binding sites, and the consideration of various candidate fragments for simulation. The second part discusses the technical aspects that various methods have used to simulate fragment binding to a target protein by using Monte Carlo, molecular dynamics, and docking algorithms.
