Maintenance Manual Combined Cycle Power Plant

Abstract. Combined cycle power plant plays an important role to generate electricity in an efficient way. The greater efficiency achievement is due to the reason that the exhaust heat energy from the gas turbine units is being utilized to produce steam for the steam turbine units. It is also true that the entire mechanical system becomes more complex than that of a single gas turbine or steam turbine plant.

The primary objective of a Combined-Cycle Cogeneration scheme is electricity production. As such, much lower Heat-to-Power Ratios are encountered, often in the range of 0.2 to 2.0. In the extreme, the Heat-to-Power Ratio could become zero, when only electrical Power is produced in the pure combined-cycle case.
